APPROVAL

BLOCKED

Countersign

The human gate for agent spend.

AGENTS PROPOSE · MANDATES AUTHORIZE · YOU COUNTERSIGN

THE PROBLEM

**The agent did the thinking.
A person did the paying.**

An agent works out that the warehouse stocks out in three days. It drafts the purchase order. Then it sends someone a notification — and a human opens a supplier portal and types in a card number.

Every “AI for operations” product stops at exactly this wall.

WHY NOBODY FIXED IT

Giving the agent a card is the worse option.

Now a model with a plausible hallucination has your card.

Finance teams haven't handed spend authority to agents because agents are bad at deciding what to buy. They haven't because nobody could answer one question:

Who authorized this, and what stopped it going further?

THE INSIGHT

Two limits. One decision.

THE AGENT'S THRESHOLD

What **we** let an agent do without a human. A line in our own config — which a bug can step over.

THE MANDATE CAP

What the **card network** will actually authorize. Enforced by Visa — but blind to whether this spend is sensible.

A spend is automatic only when both agree. Everything else escalates, or is refused.

Three questions, in the order an approver actually asks them.

01

Why is this my decision?

Over the agent's limit. No standing authorization. Budget exhausted. This leads the card — everything else is context.

02

What authorized it?

The policy clause, quoted, with its source. Not the agent's own reasoning.

03

Where does the money come from?

The mandate and what's left on it — in words, never an id.

Built in native.builder.

native.builder app

decision

Prava

mandate
charge
or
passkey

UI, database, auth, ingest, notifications, deployment — **all of it generated in native.builder.** The governor upstream is a data connection, which is one of the integrations it advertises.

WHY A PHONE

**A list is a web page.
A notification is a product.**

Approvals are the one part of a spend-governance system that never happens at a desk. The decision is small, it is urgent, and it blocks an agent that is otherwise ready to act.

Push notification → one card → two taps. Under ten seconds, standing up.

What is real today.

- The upstream governor — six deny-first gates, **78 passing tests**, MIT, public
- Live approval feed — three pending cards, three genuinely different reasons
- The card contract, including what is deliberately withheld from a phone
- The app itself — generated in native.builder during this event
- Web push, installable PWA, Supabase auth

The governor predates this event by three days and is disclosed as prior work. The **human surface has never existed** — that is what is being built here.

COUNTERSIGN

Your agents can spend now.

This is who approved it.
